INTRODUCTION

Medical Laboratory Technology also called Clinical laboratory science is an allied health profession which is concerned with the diagnosis, treatment and prevention of disease through the use of clinical laboratory tests. These tests help doctors to detect, diagnose and treat diseases. A Medical Laboratory Technologist (MLT) do these tests by analyzing body fluids, tissues, blood typing, microorganism screening, chemical analysis, cell counts of human body etc. They play an important role in collecting the information's needed, sampling, testing, reporting and documentation of these investigations. They determine the presence, extent or absence of disease and provide data needed to evaluate the effectiveness of treatment.

There are two levels of medical laboratory workers - Technicians and Technologists.

Medical technologists work in five major areas of the laboratory i.e., in Blood banking, Clinical Chemistry (chemical analysis of body fluids), Hematology (blood related), Immunology (study of immune system) and Microbiology (study of bacteria and other disease organisms). They also work in the areas of cytotechnology (study of human tissue), phlebotomy, urine analysis, coagulation, parasitology and serology. Phlebotomists draw and test blood whereas Blood bank technologists determine correct blood types for transfusions. Histology technicians cut and stain tissue samples.

Medical technologists have more training and job responsibilities. They perform complex tests such as microscopic examinations of tissues, blood and other body fluids to detect evidence of disease and detect the presence of bacteria, fungi, parasites etc and chemical tests to determine blood cholesterol levels. They also match blood samples for transfusions and test drug levels in blood to determine how patients are responding to medications. They are often responsible for making sure that testing is done accurately. In some labs, technologists conduct research under the supervision of medical researchers.

Medical technicians do routine laboratory testing manually according to instructions. They work under Technologists or supervisors. Technicians may prepare specimens and operate machines that automatically analyze samples. In addition to running tests, technicians set up, clean, and maintain laboratory equipment, such as centrifuges, microscopes etc. They also prepare standard solutions for use in the lab. This involves measuring and mixing the correct amount of various chemicals.

Some of the courses offered in Lab Technology are Bachelor of Medical Laboratory Technology (BMLT), Diploma in Medical Laboratory Technology (DMLT). BMLT course for Medical Lab Technologists is structured to train students in the clinical Laboratory analysis of blood, urine, feces, cerebrospinal fluid, synovial fluid, ascetic fluid etc to aid the doctors in arriving at a correct diagnosis and treatment of the disease. There are also Diploma / Certificate courses for lab technicians / assistants in general and in different specialties such as Diplomas in EEG Lab Technician, Histopathology Lab Technician etc.

The Medical Laboratory Technology Programs provides its graduates with numerous employment possibilities in laboratories throughout the country.

Remuneration;

The challenges and rewards of a Lab technician is high starting from Rs.6500 to 15,000.

COURSE PURPOSE:

The purpose of this course is to prepare the student for performing microbiological procedures in a real laboratory setting and to prepare the student for passing of the certification exam.

COURSE DESCRIPTION:

This course is divided into three papers. The first paper is on human biology, second on bacteriology and microbiological techniques and third on basic biochemistry.

Human Biology

The human body is basically formed of cells or groups of cells, which is organized into tissues and organs to form a complete system. The studies of system such as digestive, circulatory, etc helps in understanding how each of the system performs a function or diverse functions. Any malfunction in any of this system will disturb the homeostasis. This disturb in the homeostasis may account for change in biochemistry which may be the pathogenesis of the metabolic disorder or microbiological attack. Hence it is important to know the human biology, the biochemistry and microbiology together.

Bacteriology and Microbiological Techniques

Microbiology is the understanding of microorganisms. It covers the classification, identification, of disease-causing organisms such as bacteria, fungi, yeasts, viruses, rickettsiae, chlamydiae, and parasites. Major emphasis is on the related theory that covers microbiological procedures as sterilization, collection and preparation of specimens, culturing methods, media preparation, staining techniques, maintenance of cultures for microbiological examinations, antibiotic susceptibility testing, and identification of commonly cultured bacteria.

Basic Biochemistry

Biochemistry involves understanding the structure and metabolism of the various dietary constituents which is assimilated by the cells for vital functioning of cells. The essential dietary constituents include carbohydrates, proteins, and lipids. The enzymes are indispensable in all metabolic process.

COURSE OBJECTIVES:

- Upon completion of this course, the student will be able to:
1. Explain infections; types and transmission
 2. Identify principles of sterilization and disinfection.
 3. Name and describe the parts of a bacterial cell.
 4. Explain requirements for cultivation of bacteria.
 5. Explain common microbiology stains
 6. Perform and interpret the Gram stain.
 7. Use correct terminology to describe colonies on commonly used media
 8. Prepare and utilize culture media
